

Repository Guide

Your repo is graded from MS2 on, at the last commit before each deadline, and reviewers clone it. A few things must be in fixed places; inside your code you are free.

A checklist for your repository, not a template to copy. Deadlines and weights: see the project slides.

Required

README.md	By MS4: prediction · FTI diagram · clone-and-run steps · live URL · video link
docs/	proposal.pdf, ms2_summary.pdf, ms3_summary.pdf, ms4_summary.pdf
tests/	Unit tests, run in CI
.github/workflows/	Scheduled pipelines, CI, deploy (or Airflow DAGs)
Pinned dependencies	uv.lock or requirements.txt with exact versions
Dockerfile	Plus docker-compose.yml if you run several services
.env.example	Variable names with placeholder values only
.gitignore	Covers .env, data, mlruns/, model artifacts

Example structure

One possible way. Adapt freely; only the required items above are fixed.

```
my-project/
├── README.md
├── docs/                proposal.pdf, ms2_summary.pdf ..., architecture.png
├── src/<package>/
│   ├── features/       feature pipeline (ingest, backfill, compute, write)
│   ├── training/       training pipeline (read features, train, evaluate, register)
│   ├── inference/      inference pipeline (load model, predict, serve)
│   └── common/         shared code (config, IO, feature definitions)
├── ui/                 Streamlit / Gradio / web front end
├── config/             settings without secrets
├── tests/
├── notebooks/          exploration only
├── .github/workflows/
├── Dockerfile
├── pyproject.toml + uv.lock
├── .env.example
└── .gitignore
```

TIP Keep feature definitions in one place used by both training and inference; this avoids training-serving skew.

RULES

- tag milestones: `git tag ms2 && git push --tags`
- no secrets in the repo or its history; a leaked key must be rotated
- no data, model files or mlruns/ in git
- pipelines never import from notebooks
- keep the repo public and reachable all semester
